EXPERIMENT 7

Integration with External APIs Using Zoho Creator

Aim

To study and implement external API integration in Zoho Creator using Deluge functions and the invokeurl task.

Software Required

- Zoho Creator
- Deluge scripting
- Internet connection
- Public test API: https://jsonplaceholder.typicode.com/todos/1

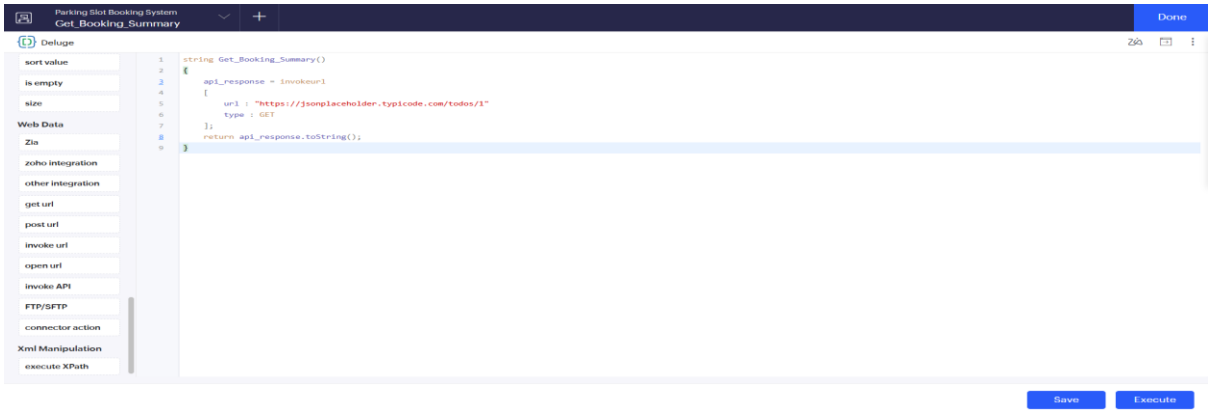

Theory

API integration allows one application to exchange data with another application through HTTP requests. Zoho Creator supports API calls using Deluge's invokeurl task. The GET request retrieves information from an external service, and the response can be processed within the function.

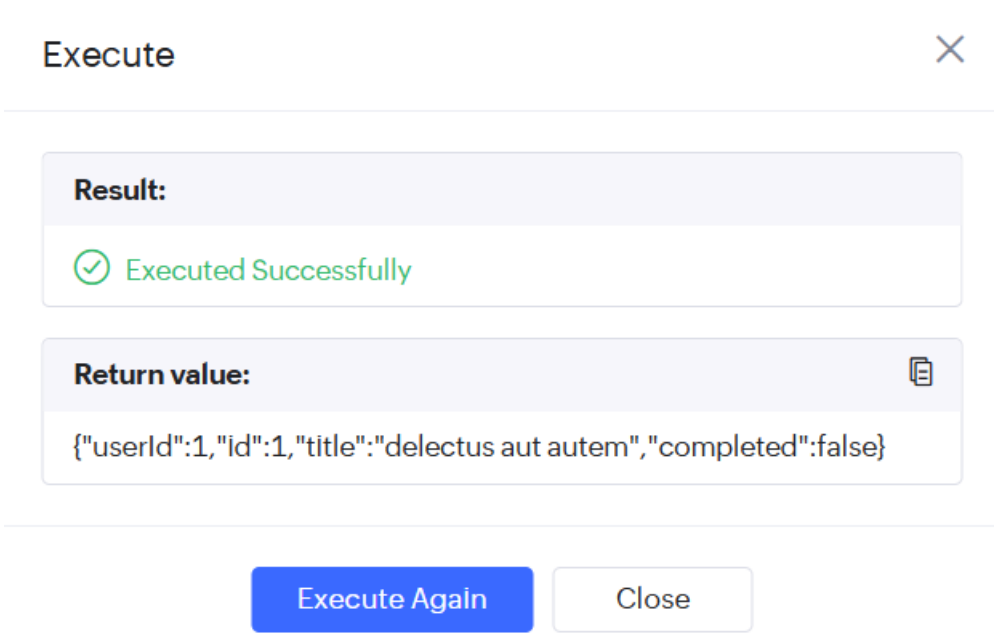

Procedure

1. Opened the existing Parking Slot Booking System in Zoho Creator.
2. Navigated to Workflow and selected Functions.
3. Created a custom function named Get_Booking_Summary.
4. Selected Deluge as the scripting language and String as the return type.
5. Used the invokeurl task to send a GET request to a public test API.
6. Executed the function and inspected the returned JSON response.

Program

Output

Result

An external API was successfully accessed from a Zoho Creator Deluge function using the HTTP GET method. The returned JSON response demonstrated successful communication with the test API.
