EXPERIMENT 10

Applying Performance Optimization Techniques in Zoho Creator

Application Name: Parking Slot Booking System
Platform: Zoho Creator

1. Aim

To study and apply performance optimization techniques, including indexing, subforms, and query tuning, in the Parking Slot Booking System developed using Zoho Creator.

2. Software Requirements

- Zoho Creator
- Web browser
- Parking Slot Booking System application

3. Theory

Indexing: Indexing helps improve the retrieval of records by allowing the system to locate relevant data more efficiently. Indexing availability and configuration depend on the platform and field type.

Subforms: Subforms allow related information to be collected as multiple entries within a parent form. They help organize related data and reduce the need for separate forms for closely connected details.

Query Tuning: Query tuning improves the efficiency of data retrieval by filtering records according to specific conditions and displaying only the required information.

4. Procedure

Step 1: Open the Application

1. Log in to Zoho Creator.
2. Open the Parking Slot Booking System application.
3. Navigate to the Parking Slot form and its associated report.

Step 2: Examine Indexing

1. Open the field properties in the Parking Slot form.
2. Examine the available field settings.
3. Check whether an indexing option is available for the selected field.

4. Record the available indexing settings without assuming that indexing is enabled.

Step 3: Configure and Review the Report

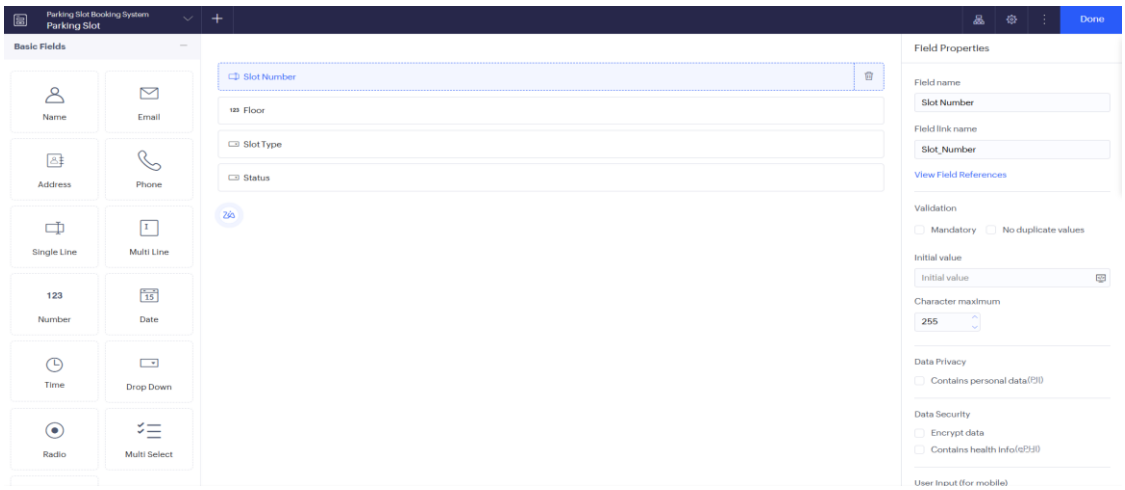

1. Open the Parking Slot Report.
2. Configure the fields displayed in the web report.
3. Open the report properties and navigate to the filter settings.
4. Configure the filter condition to display available parking slots.
5. Use the condition status == "available" where applicable to the field's actual link name and stored choice value.
6. Open the report and check the displayed records.

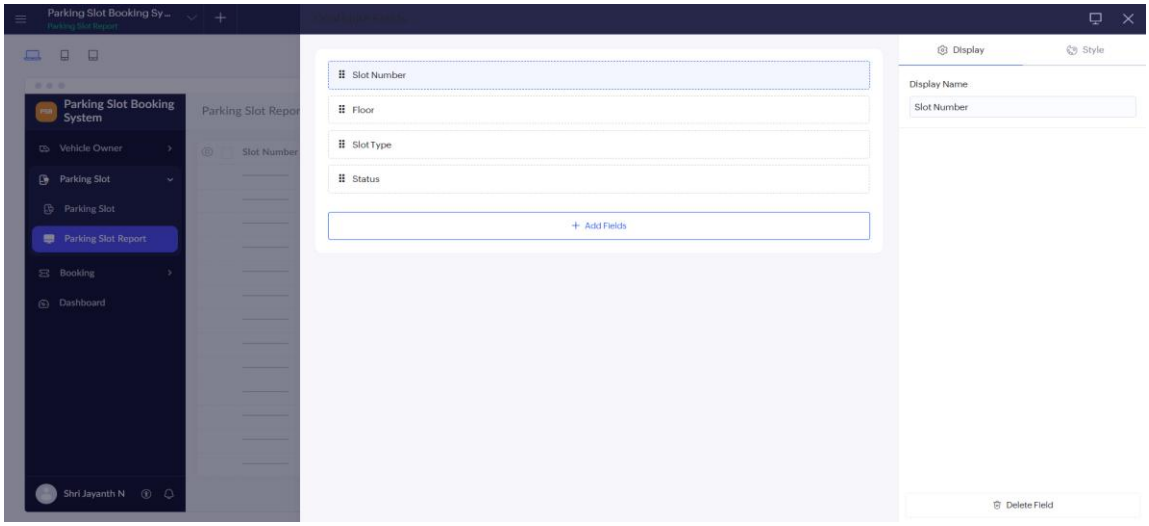

Step 4: Review Subforms

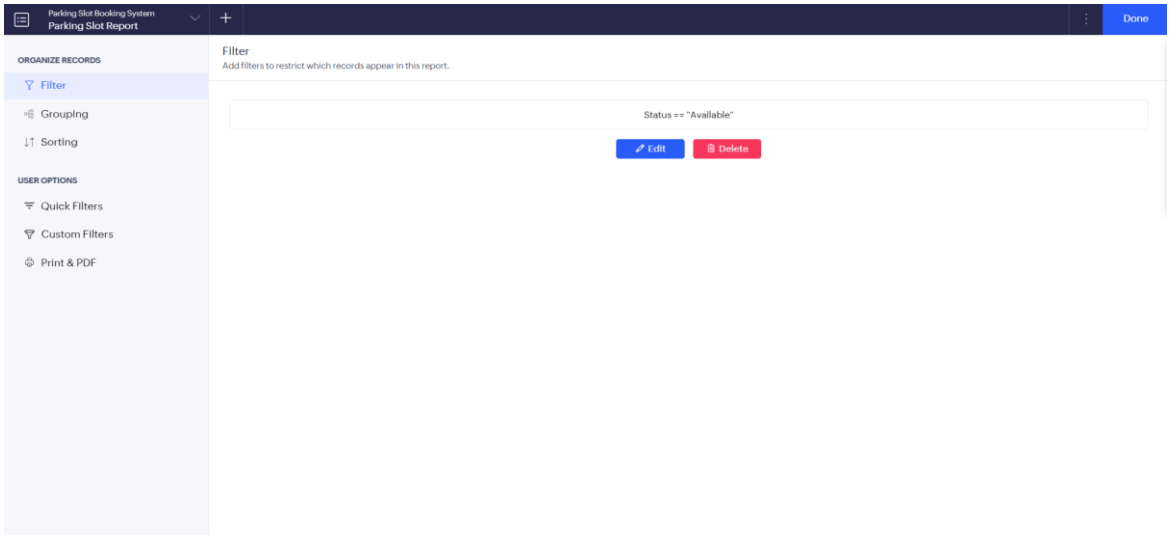

1. Open the relevant form in the application builder.
2. Examine the available form fields and subform options.
3. Where supported and required, configure a subform to collect related booking details.
4. Save the configuration and test the form if a subform is added.

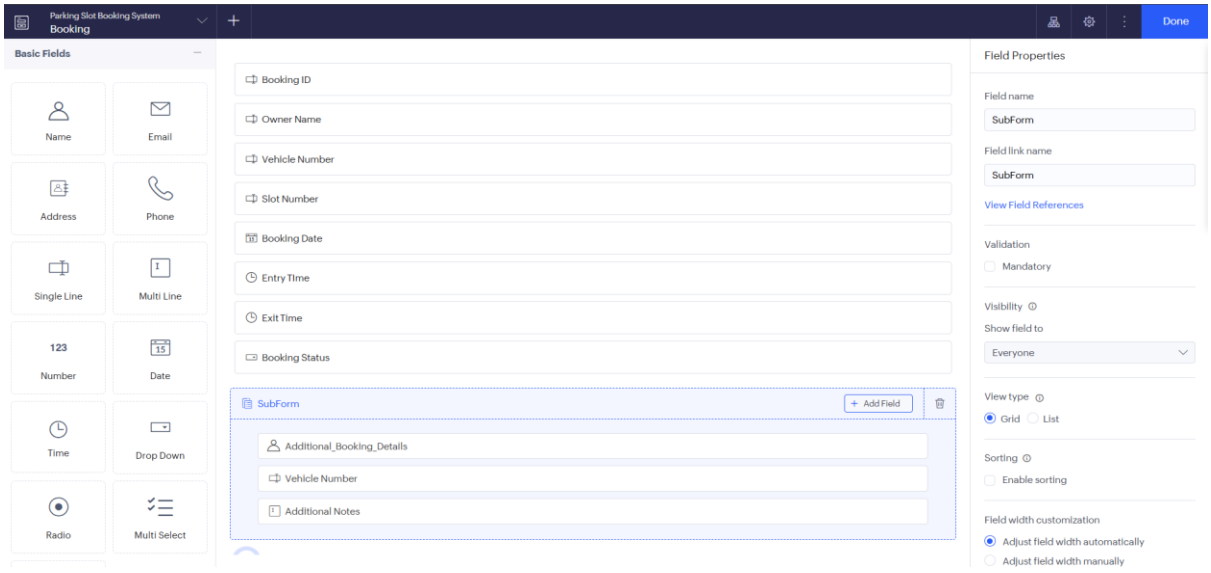

Step 5: Verify the Result

1. Open the Parking Slot Report.
2. Verify that the filter displays records matching the selected status.
3. Check the configured fields and any subform entries, if applicable.
4. Record the observations.

5. Result

The Parking Slot Booking System was configured and reviewed for performance optimization. Report field configuration and filtering were examined to retrieve parking slot records based on their status. Indexing and subform functionality were evaluated according to the options available in Zoho Creator.

6. Conclusion

This experiment demonstrates how report filtering, appropriate form design, subforms, and supported indexing options can contribute to better data organization and retrieval in Zoho Creator. Actual performance improvements should be confirmed through testing.
