EXPERIMENT 8: IMPLEMENTATION OF USER ROLES AND ACCESS CONTROL IN ZOHO CREATOR

1. Aim

To understand and implement user roles and access control in Zoho Creator by configuring permissions for forms, reports, and dashboards in the Parking Slot Booking System.

2. Software Requirements

- Zoho Creator
- Google Chrome web browser
- Parking Slot Booking System application

3. Description

Zoho Creator provides user access control features to manage the permissions granted to different users. These permissions help control how users interact with application components, including forms, reports, and dashboards.

In the Parking Slot Booking System, the Permissions section provides existing profiles named **Read** and **Write**. The Read profile is intended for users who need to view application information, while the Write profile is intended for users who require write access.

Module Permissions allow access to be managed for components such as the Booking form, Booking Report, Parking Slot Report, Vehicle Owner Report, and Dashboard.

4. Procedure

1. Log in to Zoho Creator using valid credentials.
2. Open the Parking Slot Booking System application.
3. Navigate to the Settings section.
4. Open the Permissions section.
5. View the existing profiles named Read and Write.
6. Select the Read profile to inspect its permission settings.
7. Open the Module Permissions section.
8. Identify the available application components, including the Booking form and associated reports.

9. Examine the available permission options, such as Access, View, Edit, and Delete.
10. Configure the available permissions according to the intended user access requirements, where permitted.
11. Inspect the Write profile to understand how write permissions differ from read permissions.
12. Save any changes if the account allows configuration and verify the resulting settings.

5. Observations

The following profiles and application components were available in the Permissions section:

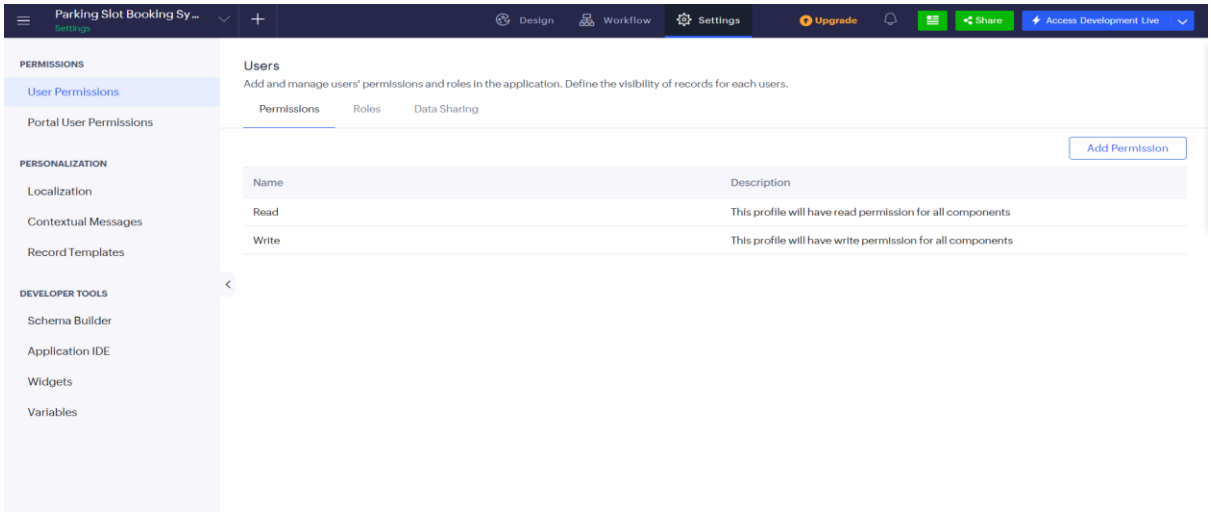

Profiles:

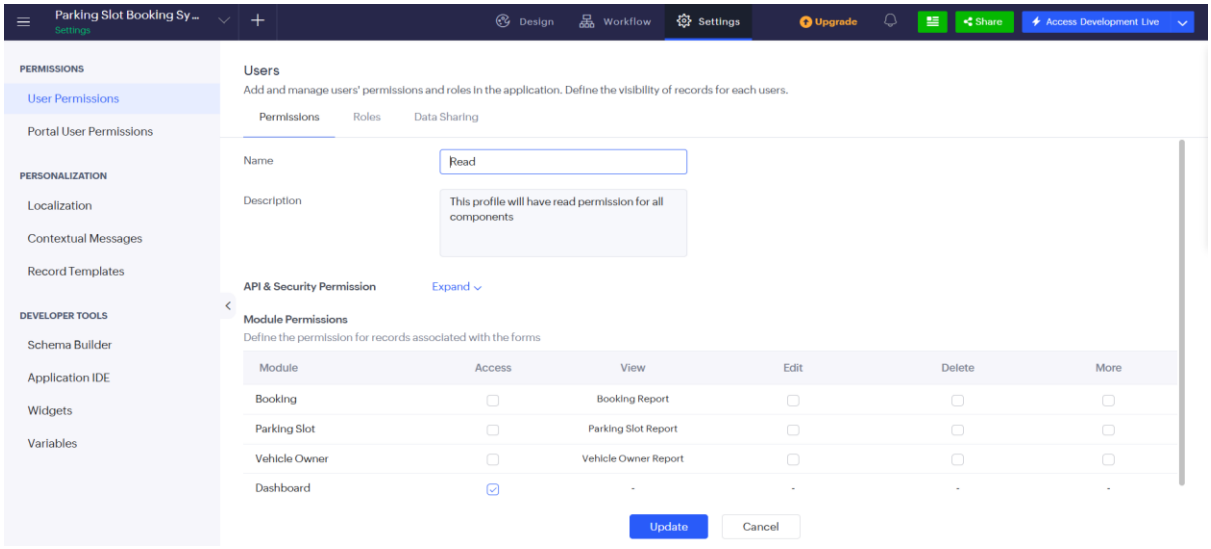

- Read
- Write

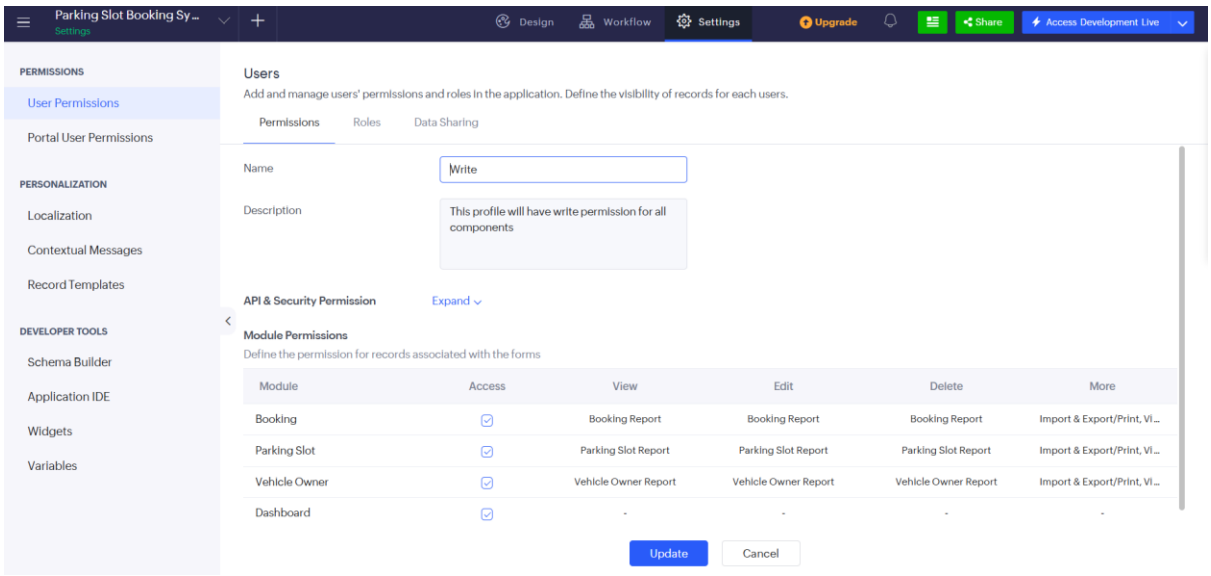

Application components:

- Booking
- Booking Report
- Parking Slot Report
- Vehicle Owner Report
- Dashboard

The Module Permissions section provides controls for managing access to application components and their associated records.

6. Result

The user permission profiles and Module Permissions section of the Parking Slot Booking System were explored in Zoho Creator. The available access-control settings for forms, reports, and dashboards were examined.

7. Conclusion

This experiment demonstrates the role of user profiles and module-level permissions in controlling access to a Zoho Creator application. Read and Write profiles support different access requirements and help organize application security. Appropriate permission configuration can improve data security and prevent unauthorized operations
